

EVERY DROP COUNTS.

Each drop of the crude oil you handle is a little piece of your profit. So make sure you're

- getting it all –
- and keeping it all –

with the OilFlux™ suite of 15 up, mid, and downstream production and flow stream additives which eliminate the 15 profit robbing “paint points”.

OilFlux™ oil field production chemical additives feature a new revolutionary chemistry based upon anionic/nonionic molecular properties that act as fluidifiers and drag reducing agents, incorporating themselves into the crude oil. Our additives lower the kinematic viscosity of crude oil and do not evaporate ... which means that the chemistry of the crude oil does not change, and it continues to flow without re-heating and increased pumping pressure. Our additives are used at low dosages of about 0.1 to 0.5% of the volume of the crude oil.

OilFlux™ additive's components are recovered separately at the refinery in each part of the distilled fraction to which it corresponds by its evaporation point as a saleable product.

This simply means enhanced profitability.

In addition, OilFlux™ suite of 15 “building block” additive products removes wax/paraffin, asphaltenes, bacteria, incrustations and foam, separates water from the “crude oil/water” emulsion, reduces sulfidric acid build-up and corrosion, recuperates 100% of the crude oil from ponds/pits, plus, improves combustion performance, eliminates “oil snot” build-up, and finally, cleans all types of tanks and tankers and crude oil spills, solving all 15 profit robbing “pain points”.

OilFlux™ products address each of the crude oil production and HSE problem areas “pain points” in crude oil extraction and flow stream delivery, speedily, safely, economically and environmentally.

OilFlux™ products are non-residual contaminants and environmentally safe.
